- 1. Follow the lab lecture about JavaDoc and unit tests then continue from step 2.
- Download the ListyCity code from the following link if you don't have it with you. Git clone the repo below using the git commands you learned during Lab 4. <u>https://github.com/Jakaria08/CMPUT-301-CustomList</u>
- Create a new class CityList under com.example.simpleparadox.listycity We will write JavaDoc comments for this class and also test this class by writing unit tests.

/**								
* 7	This is a c	lass that	keeps	track	of a	list d	of city	objects
*/								
pub	olic class	CityList {						
}								

- Declare a list to hold the city objects.
 private List<City> cities = new ArrayList<>();
- 5. Implement a method to add city objects to this list. If a city already exists then throw Exception. Here we also have written JavaDoc comments with **@param** tag.

6. Create another method to get a list of city objects sorted according to the city name. Here we also have written JavaDoc comments with **@return** tag.

7. In the CityList class the <u>Collections.sort(list)</u>: line shows an error. We want to sort the name of the cities but we are trying to sort the city objects. To sort an Object by its property, we have to make the Object *implement* the *Comparable* interface and *override* the *compareTo()* method. *Lists* (and arrays) of objects that implement *Comparable* interface can be sorted automatically by *Collections.sort()*. We also need to implement the method *compareTo()*. All wrapper classes and *String* class implement *Comparable* interface. *Wrapper* classes are compared by their values, and strings are compared lexicographically. To know more:

https://howtodoinjava.com/java/collections/java-comparable-interface/

 Go to the City class and make sure it looks like the following with *Comparable<city>* interface and *compareTo()* method implementation: package com.example.simpleparadox.listycity;

public class City implements Comparable<City> {
 private String city;
 private String province;

 City(String city, String province){
 this.city = city;
 this.province = province;
 }

 String getCityName(){
 return this.city;
 }

 String getProvinceName(){

return this.province;
}
@Override
public int compareTo(City city) {
 return this.city.compareTo(city.getCityName());
}

9. Now the error disappears and you can sort the city objects according to the city names. If two cities are equal then *compareTo()* method returns 0.

10. Finally, the CityList class:

}

```
package com.example.simpleparadox.listycity;
```

import java.util.ArrayList; import java.util.Collections; import java.util.List;

/**

This is a class that keeps track of a list of city objects

*/ public class CityList {

private List<City> cities = new ArrayList<>();

/**
 * This returns a sorted list of cities
 * @return
 * Return the sorted list
 */
public List<City> getCities() {
 List<City> list = cities;
 Collections.sort(list);
 return list;
 }

}

- 11. Select **Tools -> Generate** JavaDoc to create HTML java documentation from your JavaDoc comments. Select the **"Module app"** and select the **output directory**.
- 12. We will use junit 5 for this lab. By default junit 4 is included. To use junit 5, Include testImplementation 'org.junit.jupiter:junit-jupiter-api:5.0.1' testRuntimeOnly 'org.junit.jupiter:junit-jupiter-engine:5.0.1'

under *dependencies* on app Gradle (*build.gradle(Module:app)*) file and sync it. From official docs:

Junit-jupiter-api

JUnit Jupiter API for writing tests and extensions.

Junit-jupiter-engine

JUnit Jupiter test engine implementation, only required at runtime.

- 13. Under com.example.simpleparadox.listycity(test) folder, create a new class CityListTest to test the functionalities of our CityList class.
- 14. Create two private methods for creating a mock city object and adding to the cityList. package com.example.simpleparadox.listycity;

import org.junit.jupiter.api.Test;

import static org.junit.jupiter.api.Assertions.*;

class CityListTest {

15. Write a test for the add() method which is in CityList class. Write it under the mockCity() method. Add city objects using add() method and check if the addition is successful by assertEquals() and assertTrue(). We need to add @Test before any test method to identify it as a junit test.

@Test void testAdd() { CityList cityList = mockCityList();

assertEquals(1, cityList.getCities().size());

}

16. Write another test method for Exception while adding a city that already exists in the list.

17. If you get an error like "Lambda expressions not supported at this language level" Then the solution: Change the java language to version 1.8 (Go to File \rightarrow Project Structure)

	Pi	roject Structure
+ -	Properties Signing Flavors Build	d Types Dependencies
SDK Location Project	Compile Sdk Version API 26: And	Iroid 8.0 (Oreo)
Developer Ser	Build Tools Version 26.0.2	▼
Authentication	Library Repository	
Notifications	Ignore Assets Pattern	
app	Incremental Dex	
	Source Compatibility 1.8 🔻	
	Target Compatibility 1.8 🔻	
		Cancel

18. Write another test method to test the getCities() method in the CityList class.

@Test
<pre>void testGetCities() {</pre>
CityList cityList = mockCityList();
<pre>assertEquals(0, mockCity().compareTo(cityList.getCities().get(0)));</pre>
City city = new City("Charlottetown", "Prince Edward Island");
cityList.add(city);
assertEquals(0, city.compareTo(cityList.getCities().get(0)));
<pre>assertEquals(0, mockCity().compareTo(cityList.getCities().get(1)));</pre>

19. Run the tests (right-click on the test folder) and see the test output as following:

<u>F</u> ile <u>E</u> dit <u>V</u> iew <u>N</u> avigate <u>C</u> ode Analy <u>z</u> e <u>R</u> efactor <u>B</u> uild R <u>u</u> n <u>X</u> Cu <u>t</u>	Ctrl+X

Tests passed: 4 (11 minutes ago)			

- 20. The tests can be written before the real implementation of the *CityList* class. We can implement all the tests first and they must fail as there is no implementation of *CityList* class and its methods. Then we can give implementation of the class and methods. Then our tests would pass. This is called test-driven development. You can also follow this method.
- 21. Complete CityListTest class:
